An example of a power system is the electrical grid that provides power to homes and industries within an extended area. The electrical grid can be broadly divided into the generators that supply the power, the transmission system that carries the power from the generating centers to the load centers, and the

Electric power systems (EPS) are real-time energy delivery systems that generate, transport, and supply electrical energy instantaneously, balancing generation and demand at all times.

Generating SubstationTransmission SubstationSub-Transmission SubstationDistribution SubstationIn generating station the fuel (coal, water, nuclear energy, etc.) is converted into electrical energy. The electrical power is generated in the range of 11kV to 25kV, which is step-up for long distance transmission. The power plant of the generating substation is mainly classified into three types, i.e., thermal power plant, hydropower plant and n...See more on circuitglobe
