---

Learn about the science behind wind blades and how they are designed to capture energy from the wind and turn it into ...

Modern commercial wind turbines produce electricity by using rotational energy to drive an electrical generator. They are ...

A wind turbine generates electricity by converting wind's motion into mechanical energy, and then into electrical energy through a generator. It is a ...

Wind turbines work on a simple principle: instead of using electricity to make wind--like a fan--wind turbines use wind to make electricity. Wind turns the propeller-like blades of a turbine around a rotor, ...

Energy harnessed by wind turbines is variable, and is not a "dispatchable" source of power; its availability is based on whether the wind is blowing, not whether ...

Because power is proportional to the cube of wind speed, a small increase in wind velocity yields a much larger increase in power output. This is why turbines are designed with tall ...

Wind turbines are turned by moving air. Hydroelectric turbines are turned by water flowing down through pipes. Wave and tidal turbines are turned by the ...

Find out how a wind turbine can use the power of the wind to generate energy in this science fair engineering project. You'll design various blades to find out ...

Wind flows over the blades creating lift (similar to the effect on airplane wings), which causes the blades to turn. The blades are connected to a drive shaft that turns an electric generator, ...

# There is a mountain with wind blades generating electricity

Anemometer data can help businesses, developers, farmers, ranchers, homeowners, and municipalities determine whether there is enough wind energy at a site to make a wind turbine ...
