-----

The implicit `__class__` used by `super` does not exist at this point. Thus, referencing the superclass by the hardcoded name, as one had to do prior to `super` in Python2 will work - and is the ...

A diretiva `super`, sem parâmetros, permite ainda invocar métodos da classe que foi derivada através da seguinte syntax. `super.metodo()`; Isto é útil nos casos em que fazemos override ...

As for chaining `super::super`, as I mentioned in the question, I have still to find an interesting use to that. For now, I only see it as a hack, but it was worth mentioning, if only for the differences with Java ...

`super()` lets you avoid referring to the base class explicitly, which can be nice. But the main advantage comes with multiple inheritance, where all sorts of fun stuff can happen.

"super" object has no attribute "`__sklearn_tags__`". This occurs when I invoke the fit method on the `RandomizedSearchCV` object. I suspect it could be related to compatibility issues ...

`super()` is a special use of the `super` keyword where you call a parameterless parent constructor. In general, the `super` keyword can be used to call overridden methods, access hidden ...

In fact, multiple inheritance is the only case where `super()` is of any use. I would not recommend using it with classes using linear inheritance, where it's just useless overhead.

Thirdly, when you call `super()` you do not need to specify what the super is, as that is inherent in the class definition for `Child`. Below is a fixed version of your code which should perform ...
